Executive summary

The analysis delves into key aspects of sales, profitability, product categories and delivery costs, revealing deep trends and dynamics in the company's performance.

1. General: Sales volumes increase annually with a noticeable peak towards the end of the year, potentially reflecting seasonal fluctuations in demand. Profit trends by season show peaks in September and November, demonstrating seasonal trends in revenue generation. The Standard class is the most profitable and the Same Day class is the least profitable. Seasonal changes in shipping costs over four years, with costs peaking in 2022, indicate changing cost structures over time.

2. Sales performance across markets: Global sales dynamics indicate that the US is a major market with significant sales volumes. The Asia-Pacific region leads in domestic sales, with the United States dominating among individual countries. Delivery costs in the Central region are particularly high due to factors such as living standards, taxes and duties.

3. US Sales Analysis: California has the highest shipping costs, potentially dependent on geographic factors. California becomes the top seller.

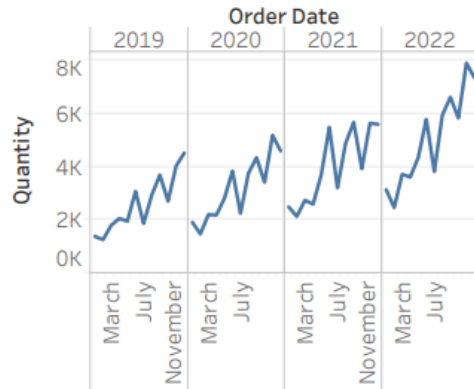

4. Top Selling Product Categories: Analysis of popular product categories shows that furniture and appliances are the top performers, reflecting high demand and revenue generation.

5. The analysis focuses on shipping costs and the impact of order priority levels on shipping costs, shedding light on cost variations and profitability at different priority levels. The first class represents the highest order processing priority. Profits from First Class bookings have shown significant growth over three years. Same day is the second most effective and expensive category. Increasing shipping costs across all priority tiers between 2019 and 2022 mean cost dynamics will change based on order urgency and processing requirements.

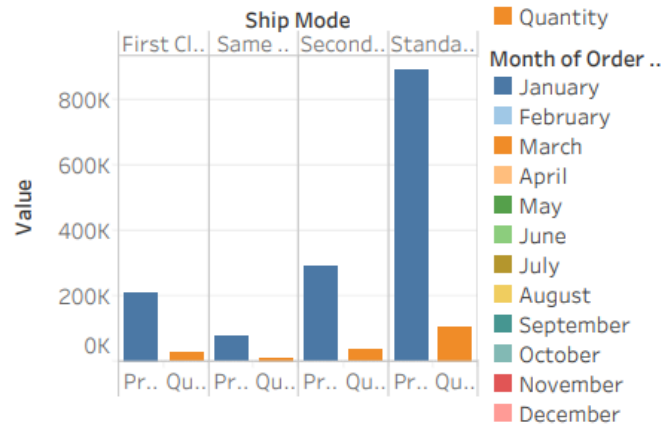

1. General provisions

First it is necessary to look at the big picture (Workspace11). It is noticeable that the number of goods sold increases every year, and significantly. Zigzag growth may indicate seasonality and fluctuations in demand for products throughout the year. Some products may have higher demand during certain months (such as holiday periods), resulting in changes in sales volumes. The number of goods sold increases each time closer to the end of the year. The second graph (Workspace12) shows the dynamics of profit by season. It can be seen that the peaks for the entire period were reached in September, November and December of 2022. The Workspace13 in the dashboard shows the profit and quantity of products sold for each ship mode. The highest indicators are typical for the Standard class, the lowest for the Same Day class. The dynamics of changes in shipping costs seasonally over 4 years are also shown (Workspace14). Peaks were reached in 2022.

2. Where are the best sales?

Next, the dynamics of sales in various countries around the world and the share of each of the above markets in the total number of sales were reviewed. A map on Workspace21 attached on which it is can see the corresponding distribution by sales intensity. The largest sales volumes are made in the USA. According to Workspace22, the Asia-Pacific region is the leader in terms of sales of goods in its domestic market. It accounts for 28.35%, while the US accounts for 18.18%. But the USA is the leader among individual countries. Due to Workspace23, shipping in the Central region (EU, USA, Canada) is the most expensive for customers. This is not surprising, because in this region prices for such services are quite high. This may be due to the higher standard of living in these countries, and, accordingly, higher taxes and duties.

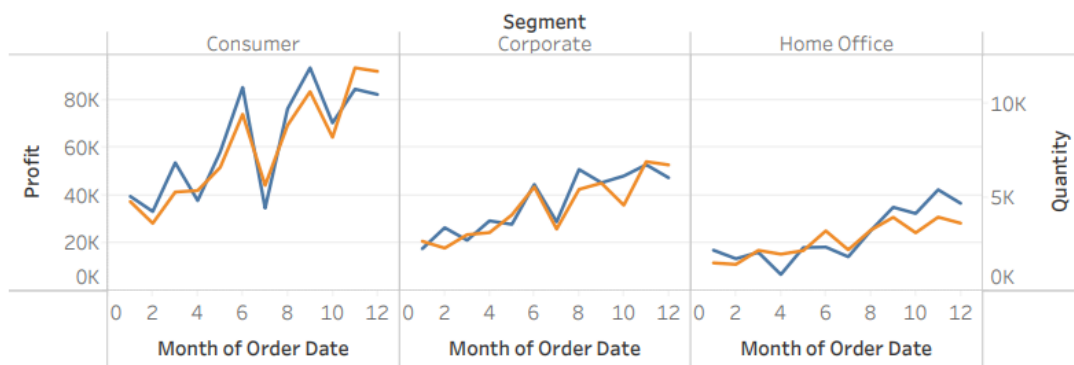

3. US sales details

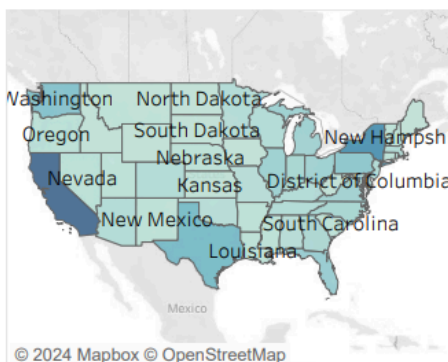

220672681

Let's move on to specific statistics for the USA. The Workspace31 line graph compares profit and sales by customer segment in the United States. It allows users to compare profits and sales across different customer segments by month. This will help determine which segments generate more profit and what the sales volume is in each month. Below is a bar chart (Workspace32) of total shipping costs for each state. California stands out among all, as it is the state with the highest total shipping costs and the highest total shipping costs (this can be partially explained by the following graph). The graph compares total shipping costs between different states in the US, which can help identify differences in shipping costs based on geographic location. For clarity, there is a Workspace33, a map of the United States showing total sales for each state. Highest sales in California (457,653).

Workspace32

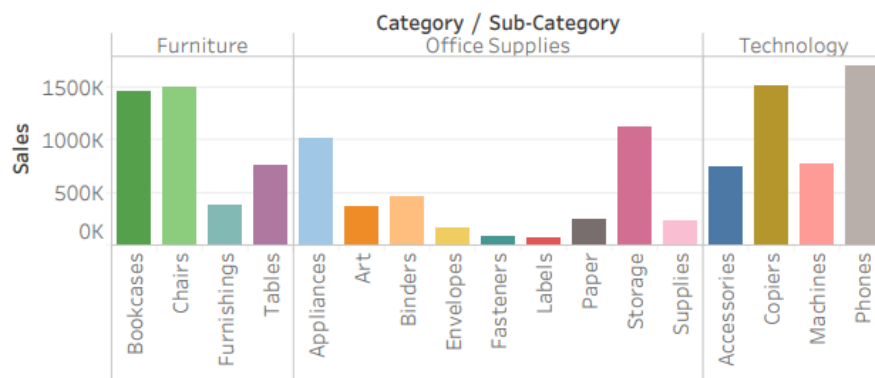

4. What sells best

The next part of the analysis is popular product categories. The graph (Workspace41) shows that Bookcases, Chairs, Copiers and Phones are the most profitable product categories if they

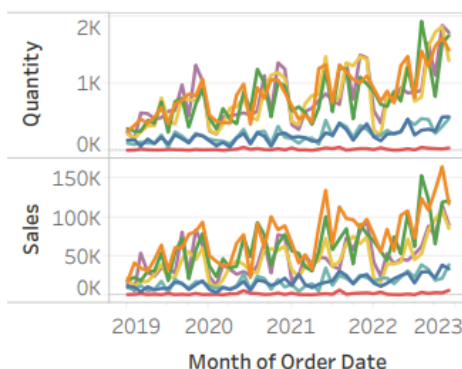

220672681

have the highest sales figures on the graph. This may indicate that these product categories are in high demand and generate the most revenue for the company. Also, Chairs and Copiers are the most popular and successful items in assortment if they generate the highest sales. This may indicate that these products are selling well and generating high profits. The Workspace42 graph shows profit, units sold, and sales for three segments. Thus, the greatest profit comes from the sale of equipment to consumers, the largest quantities of furniture are sold to consumers, and the smallest quantities of furniture and equipment for home offices are purchased. The third graph (Workspace43) shows the dynamics of sales and quantity of products for all types of markets. It can be seen that almost all markets are increasing their sales and product turnover.

5. Shipping. Shipping price and its dependence on order priority

Finally, it is worth studying shipping costs and understanding how order priority affects the cost of their delivery. The graph (Workspace51) shows:

- First Class indicates the highest order processing priority. This type typically refers to orders that require fast and priority processing, possibly using special delivery services or

additional services. Therefore, this is a rather expensive tariff. Over three years, the profit from it has grown very significantly and at its peak during the period under review amounted to almost 70K.

- Same Day indicates orders that must be processed and delivered on the same day on which they are placed. This priority typically applies to orders that require emergency delivery or fulfillment within a short time. This category is the second most efficient and expensive.
- Second Class means a priority level lower than First Class, but higher than Standard Class. This priority level may mean faster processing and delivery than Standard Class, but not as urgent as First Class or Same Day. Judging by the graph, the tariff is also quite profitable; at its peak, the profit exceeded 60K.
- Standard Class generally refers to orders that are processed and delivered according to standard procedures and deadlines, without special acceleration or additional services. In this regard, this category is the most accessible, and it is significantly less profitable than the others.

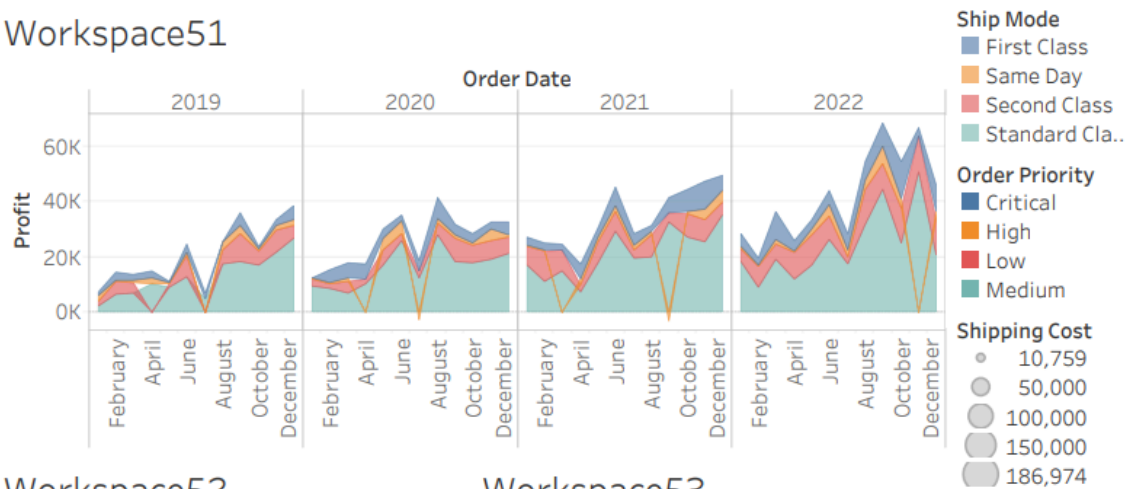

The Workspace52 graph shows the same dependence, but for Shipping Cost. The graph shows changes in delivery costs by year for orders with different priority levels. The increase in shipping costs in each color category over time (2019 to 2022) indicates changes in shipping costs.

Using the example of American states, an analysis was made of how many days an order is delivered in different states. The highest average difference between delivery date and order date for the District of Columbia may indicate that the region typically takes longer to deliver items than other states. A high difference between the delivery date and the order date may indicate possible problems with the efficiency of order processing and delivery in the District of Columbia, potentially requiring additional attention and process optimization.

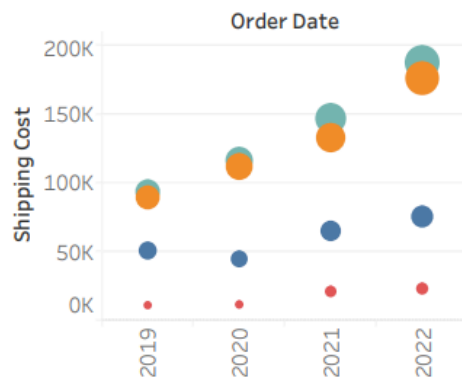

The Workspace54 figure shows a pie chart displaying the shares of the total number of products sold for each type of order priority. The average type of order priority accounts for the majority of goods sold (57.51%), while for the high level of order priority it is 30.29%, for the critical level of order priority it is 7.54%. The least number of goods sold are at the low priority level. The large share of medium priority items (57.51%) may indicate that these orders can be effectively managed and processed as they constitute a significant portion of sales. The high percentage of medium priority items (57.51%) may indicate their popularity among customers or that the majority of orders are classified as medium priority to customers. The distribution of products into order priority levels may reflect demand and the need to process orders of varying priority. A large proportion of medium priority items may indicate their significant quantity and importance to the business. A lower proportion of high and critical order priority items may indicate that the company can streamline its processing and delivery processes for orders with higher priority levels to ensure better management and customer satisfaction.

Summary and recommendations.

Sales volumes grow annually with a noticeable peak towards the end of the year, at which time it is necessary to focus on sales and marketing programs. Global sales trends indicate that the US is a major market with significant sales volumes. Also, the Asia-Pacific region leads in sales in the domestic market. Therefore, it is necessary to pay attention to these markets. Furniture and Appliances are the most effective and the ones to focus on. The first class represents the highest order processing priority and is profitable. But you need to pay attention to the other classes: Same day, Second class, Standard class, since they are used by the mass consumer.
